Variance 149.470; scale 0.225 Mean 33.575; Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A copy cione from the hippocompus cona library that had been a contains a 2.7 kb insert. The contains a 2.7 kb insert was excised from the lambda clone to yield two relevant fragments. These two fragments of the asbacione was designated pocamH3EF. Although this contains, hybridises to the bowine cam PDE 61 kD cDNA, sequence analysis revealed that it appears to be a prod. of a different Cam PDE gene. Plasmid pocamH3EF contains what may be the entire ORF and would encode a protein approx. 75 percent homologous with the protein encoded by contain sergion between nucleotide 80-100 of pocamH3EF is uncertain. This area is 5, to the initiator methionine codon and thus does not effect the ORF.
                                                                                                                                                                                                                                                                                                                                                                New DNA encoding mammalian cyclic nucleotide phospho-di:esterase - and desived vectors and host cells, useful for screening cpds. for inhibitory or activating activity example 7; Page 109; 133pp; English.
                                                                 19-WAR-1993 (first entry)
Prod. cDNA insert of pcanH3EF, homologous to CaM PDE.
Calcim/ calmodulin; stimulated; cyclic; nucleotide; bovine;
                                                                                                                                                                                                                                                                                       Beavo JA, Bentley JK, Charbonneau H, Sonnenburg WK; WPI; 92-382051/46.

alter the carboxy terminus of the protein encoded by the ORF.

pcamH3EF cDNA can encode a protein of 634 residues, and assuming
the 5' end of pcamHella cDNA 1s the same as that of the 5' end of
pcam3HEF (5' to nucleotide 610), pcamHella can encode a 709 residue
protein. These divergent 3' ends may be the consequence of alternative
splicing, lack of splicing, or unrelated DNA sequences being juxtaposed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA encoding mammalian cyclic nucleotide phospho-disesterase and derived vectors and host cells, useful for screening cpds.

Fand derived vectors and host cells, useful for screening cpds.

Fan approx. 2.4 kb fragment of pcamHist was used to screen an upprox. 2.4 kb fragment of pcamHist was used to screen a human heart cDNA library to yield two plaques which hybridised to the pcamHist probe. The Blueskript SF plasmid pcamHella was excised in vivo from one of these clones. Sequence analysis of pcamHella showed that the insert began at nucleotide 610 of pcamHist and was nearly identical to nucleotide 2066, at which point the DNA sequence diverged from that of pcamHist. The cDNA insert of pcamHella continued for ca. 0.6 kb. The consequence of this divergence is to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     42 DESIKYPYKEDTIPYALLGGIIIPPSIIVIILGETLSV-YCNLLHSNSFIRNNYIATIYK 100

083902 encodes R69733 the human cyclic-GMP stimulated nucleotide phospho-diesterase (CaM PDE) clone pecan-Hella. Eukaryotic cells that express Cam PDE clone becan-Hella. Eukaryotic cells modulate CaM PDE activity. CaM PDEs are involved in regulating the transmission of information from hormones, neurotransmitters or other systems that use cyclic nucleotides as messengers.

Antibodies raised against CaM PDE can be used for enzyme purifon, or determination.
                                                                                                                                                               New nucleic acid encoding cyclic-GMP stimulated nucleotide phospho-di-esterase - and related vectors and transformed celuseful for screening cpds. for phospho-di-esterase modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 102; DB 13; Length 564;

This sequence represents the calcium/calmodulin dependent
This sequence represents the calcium/calmodulin dependent
This sequence represents the calcium/calmodulin dependent
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was isolated from human heart mRNA. The cyclic
This cDNA insert was cappared from the cyclic micleotides.

The control of the cellular concentration of cyclic nucleotides. The PDEs are, in turn, regulated by transmembrane signals or second messenger.

Tole in regulating the flow of information from extracellular hormones, neurotransmitters, or other signals that use the cyclic nucleotides as messengers. PDEs are present in most of the cells and tissues of curvatual contentration of CAMP, and/or cGMP. The cDNA encoding this sequence can therapeutic and diagnostic uses. This protein may also be useful for clanary and the antibody production.

This combinant can be useful for antibody production.

This combinant can be useful for antibody production.

Eukaryotic cells that express CaM PDE and used to screen cpds. for the ability to modulate CaM PDE activity. CaM PDEs are involved in regulating the transmission of information from hormones, neurotransmitters or other systems that use cyclic nucleotides as messengers. Antibodies raised against CaM PDE can be used for enzyme purifor, or determination.
                                                                                                                                                                                                                                                                   related vectors and transformed cells, for phospho-di-esterase modulating
                                                                                                                                                                                                                                             New nucleic acid encoding cyclic-GMP stimulated nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 102; DB 13; L.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transcontinent entryine.

Transport of the sequence represents the calcium/calmodulin dependent

This cDNA insert was isolated from human hippocampus mRNA. The cyclic

This cDNA insert was isolated from human hippocampus mRNA. The cyclic

This cDNA insert was isolated from human hippocampus mRNA. The cyclic

C cyclic nucleotide phosphodiesterases (PDES) catalyse the hydrolysis of 3', 5'

C cyclic nucleotide monophosphates. The PDES are therefore important in the

CC cyclic nucleotides. The PDES are therefore important in the

CC control of the cellular concentration of cyclic nucleotides. The PDES

This in turn, regulating the flow of information from extracellular hormones,

CC in regulating the flow of information from extracellular hormones,

CC intracellular calcium, which leads to a decreased intracellular

CC concentration of CAMP, and/or cAMP. The CDNA encoding this sequence can

CC therepotutic and diagnostic uses. This protein may also be useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  821 piraesvrngilgyfdiaftsvftveivlkmttygaflhkgsfcrnyfnildllvvavsl 880
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     48 PYKEDTIPYALLGGIIIPF-SIIVIILGETLSVYCNLLHSNSFIRNNYIATIYKAIGTFL 106
three (see FT) also result in AA changes (see R73055 FT). The deduced As sequence yields a calculated Mr of 212,143,in contrast to the observed Mr 155K-176K, previously reported by others using SDS polyacrylamide gel electrophoresis. The AA sequence is 99.8% internal repeated sequence regions. The AA sequence is 99.8% internal repeated sequence regions. It has been proposed that the segments of the four internally repeated regions represent 24 transmembrane segments. A eukaryotic cell expressing a chimaeric consisting of chok in which the first CDNA is selected from the gp. consisting of condoss a protein that has the AA sequence in R73055 but with the Tanabe et al substitutions indicated in FT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               W04217;

The cDNA sequence Q87978 is consistent with an approx 6,500 nt DHP receptor (alpha)1 mRNA. It is 948 identical to the cDNA sequence encoding the DHP receptor reported by Tanabe et al., Nature, 328:313-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding alpha-1 and alpha-2 calcium channel sub-unit(s) for detecting calcium channel agonists/antagonists or Lambert-Eaton syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Williams ME;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (SALK ) SALK INST BIOTECHNOLOGY IND ASSOC.

This sequence is a H. pylori cell envelope protein.

This sequence is a H. pylori cell envelope protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide blinding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators of interest in the predicted coding regions fefined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by POR amplification for recombinant polypeptide Squence 186 AA;

Claim 1; Fig 3; S2pp; English.

The amino acid sequence (M44217) of rat dorsal root ganglion P2x receptor was deduced from a cDNA clone (T33854) isolated from a cDNA ibrary. P2x receptors (see also W04215-16 and W04218) are ligand-gated ion channels that open upon binding of extracellular ATP. Recombinant P2x receptors can be produced in prokaryotic or eukaryotic, pref. mammalian, host cells. Their widespread distr.

H. pylori infection or to identify H. pylori polypeptide binding
compounds, useful as potential H. pylori life cycle activators or
cinhibitors. The genomic sequence of H. pylori (Arcc 55679) was
determined from overlapping contigs generated by mechanically
shearing the bacterial DNA. The sequences were analysed for ORF of
at least 180 nucleotides, and the predicted coding regions defined
by computer evaluation. To identify likely H. pylori antigens for
vaccine development, the amino acid sequences predicted from
various ORF were analysed for significant homology to other known
c or exported membrane proteins. Having identified and determined
the sequences of interest, particular regions can be isolated from
H. pylori by PCR amplification for recombinant polypeptide
Sequence 254 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacterial Claim 56; Pages 1018-1019; 1481pp; English.
The present sequence is a Helicobacter pylori cell envelope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   'n
                            Selectively to alphalic adrenergic receptor to inhibit contraction of prostatic tissue

Example; Page 53-55; 69pp; English.

The liventors claim a method of treating benign prostatic
The liventors claim a method of treating benign prostatic
The liventors claim a method of treating the prostatic
The properplasia which comprises administering a therapeutically
effective amount of a compound which binds to a human alpha-1c
adrenergic receptor with a binding affinity greater than ten-fold
higher than the binding affinity with which the compound binds to a
creceptor. The example concerns a protocol for the determination of
the potency of alpha-1 antagonists. Cell lines were prepd, by
transfecting the cloned cDNA or cloned genomic DNA or constructs
conty both genomic DNA and cDNA encoding human alpha-adrenergic
conty both genomic DNA and cDNA encoding region and 5' and 3'
UTRS were cloned into the BamHI and Clai sites of the
ENJ:IR. For alpha-1B, the entire coding region and 5' and 3'
UTRS were cloned into the ECORI site of ECEXY-3 eukaryotic expression
vector. For alpha-1C, the entire coding region and 5' and 3'
UTRS were cloned into the KpnI site of the polylinker-modified
DUTRS were cloned into the Romi site of the polylinker-modified
CUTRS were cloned into the Romi site of the polylinker-modified
DUTRS were cloned into the Romi site of the polylinker-modified

Treating benign prostatic hyperplasia - with cpds. which bind selectively to alphalC adrenergic receptor to inhibit contraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proton transport adenosine tri:phosphatase protein and its coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tri:phosphatase
Claim 2; Page 6-7; 8pp; Japanese.
This sequence is a proton transport adenosine triphosphatase
protein from the plasma membrane of Pisum sativum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. Example 5; Figure 6: 34pp; English.

Integrins are heterodimers commissed of alpha and beta subunits, that are non-covalently associated transmembrane glycoproteins. Il alpha chains and 6 beta chains have been recognised in man. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions. Integrins mediate (in part) the interaction of cells with the extracellular matrix, forming a link between the extracellular matrix and the cytoskeleton. They may environment, affecting cell behaviour. This sequence is the alpha6 subunit of an alpha6 beta4 integrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alpha 6A integrin subunit.

The sequences given in R28821-22 are the human alpha 6A and 6B integrin subunits. Integrins are a family of cell surface receptors integrin subunits. Integrins and a family of cell surface receptors which serve cellular adhesion functions. These receptors form a link between the extracellular components. Each integrin receptor is a heterodimer comprised of an alpha and a beta subunit. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions to this rule. These integrins correspond to the laminin receptor. The cytoplasmic domain of the 6A and 6B integrins differs from previously isolated alpha 6 integrins. The buman alpha 6B was isolated from human choriocarcinoma cell line JAR squence 1073 AA;

#title Molecular analysis of the 3,6-dideoxyhexose pathway genes of Yersinia pseudotuberculosis serogroup IIA.
                                                                                                                                                                                                                                                                                 Rauschenbach, R.; Isernhagen, M.; Noeske-Jungblut, C.;
Boidol, W.; Siewert, G.
Submitted to the EMBL Data Library, March 1993
Cloning, sequencing and expression of the gene for cytoch
P450meg, the steroid 15beta-monocxygenase from Bacillus
megaterium ATCC 13368.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             114 rpdlhrlid1ggysfpsghamnafslygi1-tfl-lwrhitarwari1-1i1-fsmlmi- 168

                                                                                                                                                                                                                                                                                                                                 sequence extracted from NCBI backbone
This sequence was derived from multiple, partial, alternatively
spliced mRNAs. The sequence shown is a composite representing the
longest possible splice form. Two splice forms lead to premature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ë

PROC. NATL. ACAD. SCI. U.S.A. 88:727-731(1991).

-1- FUNCTION: CALCIUM CHANNEL PROFERIN WHICH PLAYS AN IMPORTANT ROLE IN

EXCITATION-CONTRACTION COUPLING. THE ALPHA-1 SUBUNIT BINDS

DIMYDROPYRIDINE (DHP), A CALCIUM CHANNEL BLOCKER.

-1- SUBURIT THIS L.TYPE CALCIUM CHANNEL IS COMPOSED OF TWO SUBUNITS:

ALPHA-1, AND ALPHA-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PYKEDTIPYALLGGIIIPFSIIVIILGETLSVYCNLLHSNSFIRNNYIATIYKAIGTFLF 107

THE ALPHA-1 SUBBUILT BINDS DIMYDROPYRIDINE (DHP), A CALCIUM CHANNEL BLOCKER.

-1- SUBBUILT: THE L-TYPE CALCIUM CHANNEL BLOCKER.

-1- SUBBUILT: THE L-TYPE CALCIUM CHANNEL IS COMPOSED OF FOUR SUBUNITS:

-1- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-1- TISSUE SPECIFICITY: SKELETAL MUSCLE.

-1- SIMILARITY: TO OTHER CALCIUM CHANNEL ALPHA SUBUNITS.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-i- SUBDAIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN G AND MANA.

-:- CATALYTIC ACTIVITY: ATP + H(2)O - ADP + ORTHOPHOSPHATE.
-:- SUBUNIT: POSSIBLY EXISTS AS AN HOWODIMER OR AN HOMOTRIMER.
-:- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-:- AS MANY AS 6 TO 8 CLOSELY RELATED GENES MAY ENCODE OTHER ISOFORMS OF PLASAN MEMBRANE ATPASE IN TOWARO, LIKE THE LHAI GENE PRODUCT WHICH IS 96% IDENTICAL TO THE LHAZ GENE PRODUCT.
-:- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY
                                                                                                                                                                                                  KERESZT A., SLASKA-KISS K., PUTNOKY P., BANFALVI Z., KONDOROSI A.;
SUBMITTED (NOV-1994) TO EMBL/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: REQUIRED FOR THE BIOGENESIS OF C-TYPE CYTOCHROMES.
POSSIBLE SUBUNIT OF A HEME LYASE.
-!- SUBCELLUIAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER MEMBRANE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 11.944; Variance 6.199; scale 1.927

        Kal, W. Wade, T., Imal, S., Sakane, F. and Kanoh, H. Identification and cDNA cloning of 35-Kb phosphatidic acid phosphatase (type 2) bound to plasma membranes. Polymerase chain reaction amplification of mouse H202-inducible hic53 clone yielded the cDNA encoding phosphatidic acid phosphatase 9334980.
                                                                                                                                                                                                                                                                                                                                                          ä
